

# Syntax Directed Translation

## Part I

## Syntax Directed Translation

Syntax = form, Semantics = meaning

- Technique used to build semantic information for large structures,
  - based on its syntax
- In other words... Translation of languages guided by the context-free grammars

# The Essence of Syntax-Directed Translation

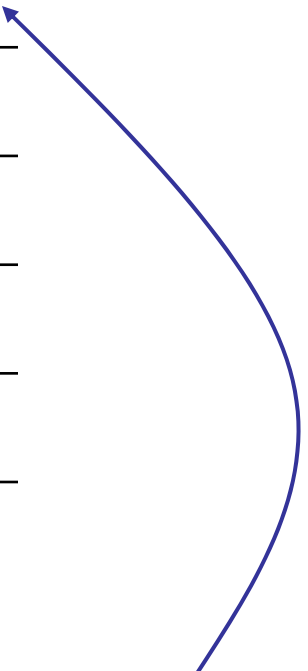

- The semantics (i.e., **meaning**) of the various constructs in the language is viewed as **attributes** of the corresponding grammar symbols.
- Example:
  - sequence of characters 495
    - grammar symbol TOK\_INT
    - meaning  $\equiv$  integer 495
    - is an **attribute** of TOK\_INT.
- Attributes are associated with **Terminal** as well as **Nonterminal** symbols.
- An attribute may hold almost any thing
  - a string, a number, a memory location, a complex record.

## The Essence of Syntax-Directed Translation

- Values of these attributes are evaluated by the **semantic rules** associated with the production rules.
- Evaluation of these semantic rules:
  - may generate intermediate codes
  - may put information into the symbol table
  - may perform type checking
  - may issue error messages
  - may perform some other activities
  - in fact, they may perform almost any activities.

## The Essence of Syntax-Directed Translation

Production	Semantic Actions
$E \rightarrow E_1 + T$	$E.val = E_1.val + T.val$
$E \rightarrow T$	$E.val = T.val$
$T \rightarrow T_1 * F$	$T.val = T_1.val * F.val$
$T \rightarrow F$	$T.val = F.val$
$F \rightarrow \text{num}$	$F.val = \text{value}(\text{num})$
$F \rightarrow ( E )$	$F.val = E.val$

*Rule = compute the value of the attribute 'val' at the parent by adding together the value of the attributes at two of the children*

# Syntax-Directed Definitions and Translation Schemes

- Two notations to associate semantic rules with productions
- **Syntax-Directed Definitions:**
  - give high-level specifications for translations
  - hide many implementation details such as order of evaluation of semantic actions.
  - We associate a production rule with a set of semantic actions, and we do not say when they will be evaluated.
  - More readable.
- **Translation Schemes:**
  - indicate the order of evaluation of semantic actions associated with a production rule.
  - In other words, translation schemes give a little bit information about implementation details.
  - More efficient.

## Syntax-Directed Definitions

- A syntax-directed definition is a generalization of a context-free grammar in which:
  - Each grammar symbol is associated with a set of attributes.
  - This set of attributes for a grammar symbol is partitioned into two subsets called **synthesized** and **inherited** attributes of that grammar symbol.
  - Each production rule is associated with a set of semantic rules.

## Syntax-Directed Definition -- Example

### Production

$L \rightarrow E \text{ n}$

$E \rightarrow E_1 + T$

$E \rightarrow T$

$T \rightarrow T_1 * F$

$T \rightarrow F$

$F \rightarrow ( E )$

$F \rightarrow \text{digit}$

### Semantic Rules

$L.val = E.val$

$E.val = E_1.val + T.val$

$E.val = T.val$

$T.val = T_1.val * F.val$

$T.val = F.val$

$F.val = E.val$

$F.val = \text{digit.lexval}$

- Symbols E, T, and F are associated with a synthesized attribute *val*.
- The token **digit** has a synthesized attribute *lexval* (it is assumed that it is evaluated by the lexical analyzer).

## Synthesized Attributes

A synthesized attribute for a non-terminal  $A$  at a parse tree node  $N$  is defined by a semantic rule associated with the production at  $N$ .

The production must have  $A$  as its head.

OR

The value of a synthesized attribute for a node is computed using only information associated with the node and the node's children (or the lexical analyzer for leaf nodes).

Example: **Production**

$A \rightarrow B C D$

**Semantic Rules**

$A.a := B.b + C.e$

## Example Problems for Synthesized

- Expression grammar – given a valid expression (ex:  $1 * 2 + 3$ ), determine the associated value while parsing.
- Grid – Given a starting location of 0,0 and a sequence of north, south, east, west moves (ex: NESNNE), find the final position on a unit grid.

## Synthesized Attributes – Expression Grammar

Production	Semantic Actions
$E \rightarrow E_1 + T$	$E.val = E_1.val + T.val$
$E \rightarrow T$	$E.val = T.val$
$T \rightarrow T_1 * F$	$T.val = T_1.val * F.val$
$T \rightarrow F$	$T.val = F.val$
<u><math>F \rightarrow \text{num}</math></u>	<u><math>F.val = \text{value}(\text{num})</math></u>
$F \rightarrow ( E )$	$F.val = E.val$

## Synthesized Attributes –Annotating the parse tree

Production	Semantic Actions
$E \rightarrow E_1 + T$	$E.val = E_1.val + T.val$
$E \rightarrow T$	$E.val = T.val$
$T \rightarrow T_1 * F$	$T.val = T_1.val * F.val$
$T \rightarrow F$	$T.val = F.val$
$F \rightarrow \text{num}$	$F.val = \text{value}(\text{num})$
$F \rightarrow ( E )$	$F.val = E.val$

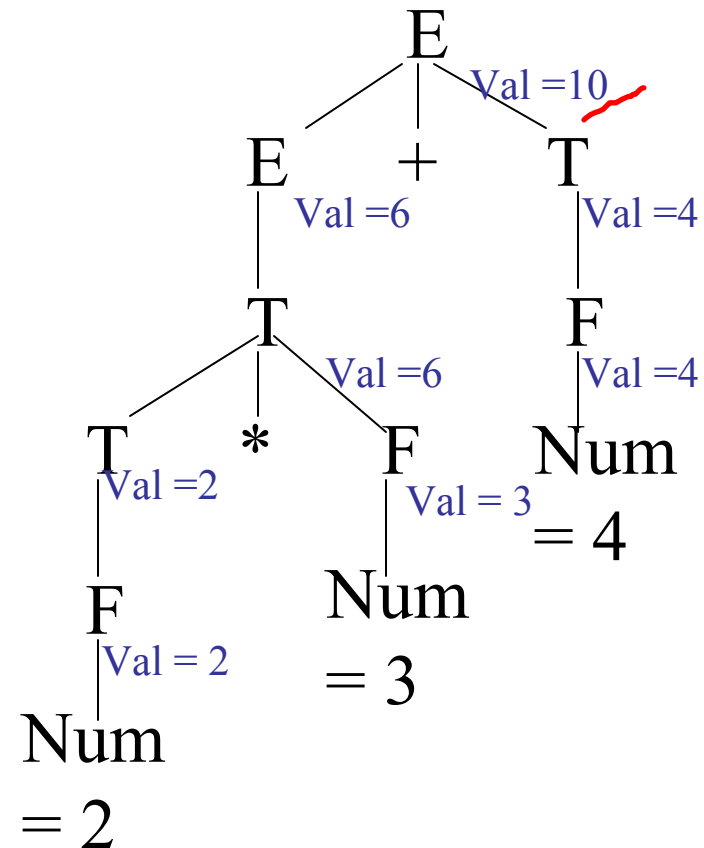

Input:  $2 * 3 + 4$

## Synthesized Attributes –Annotating the parse tree

Production	Semantic Actions
$E \rightarrow E_1 + T$	$E.val = E_1.val + T.val$
$E \rightarrow T$	$E.val = T.val$
$T \rightarrow T_1 * F$	$T.val = T_1.val * F.val$
$T \rightarrow F$	$T.val = F.val$
$F \rightarrow \text{num}$	$F.val = \text{value}(\text{num})$
$F \rightarrow ( E )$	$F.val = E.val$

Input:  $2 * 3 + 4$

## Synthesized Attributes –Annotating the parse tree

Production	Semantic Actions
$E \rightarrow E_1 + T$	$E.val = E_1.val + T.val$
$E \rightarrow T$	$E.val = T.val$
$T \rightarrow T_1 * F$	$T.val = T_1.val * F.val$
$T \rightarrow F$	$T.val = F.val$
$F \rightarrow \text{num}$	$F.val = \text{value}(\text{num})$
$F \rightarrow ( E )$	$F.val = E.val$

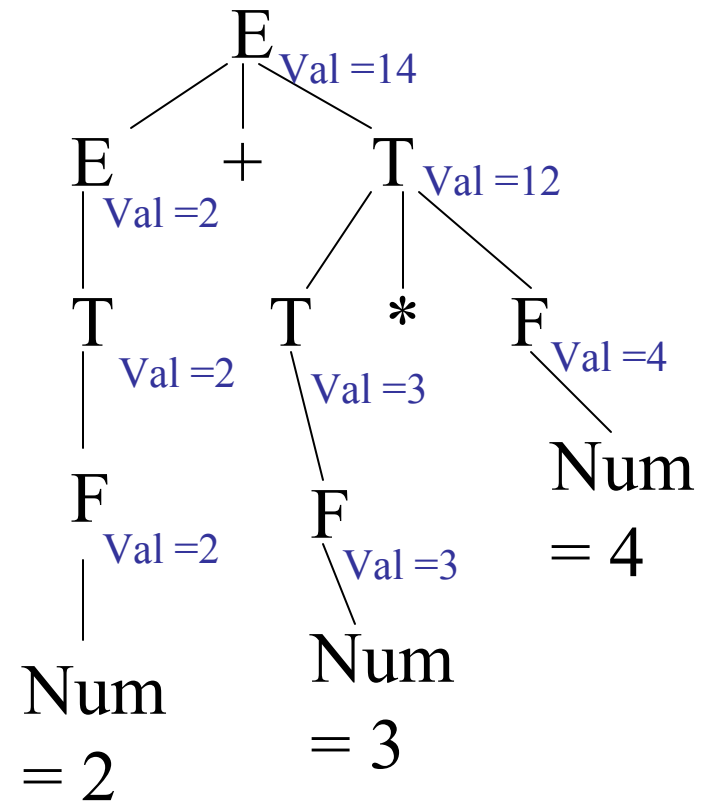

Input:  $2 + 4 * 3$

## Synthesized Attributes –Annotating the parse tree

Production	Semantic Actions
$E \rightarrow E_1 + T$	$E.val = E_1.val + T.val$
$E \rightarrow T$	$E.val = T.val$
$T \rightarrow T_1 * F$	$T.val = T_1.val * F.val$
$T \rightarrow F$	$T.val = F.val$
$F \rightarrow \text{num}$	$F.val = \text{value}(\text{num})$
$F \rightarrow ( E )$	$F.val = E.val$

Input:  $2 + 4 * 3$

## Grid Example

- Given a starting location of 0,0 and a sequence of north, south, east, west moves (ex: NEENNW), find the final position on a unit grid.

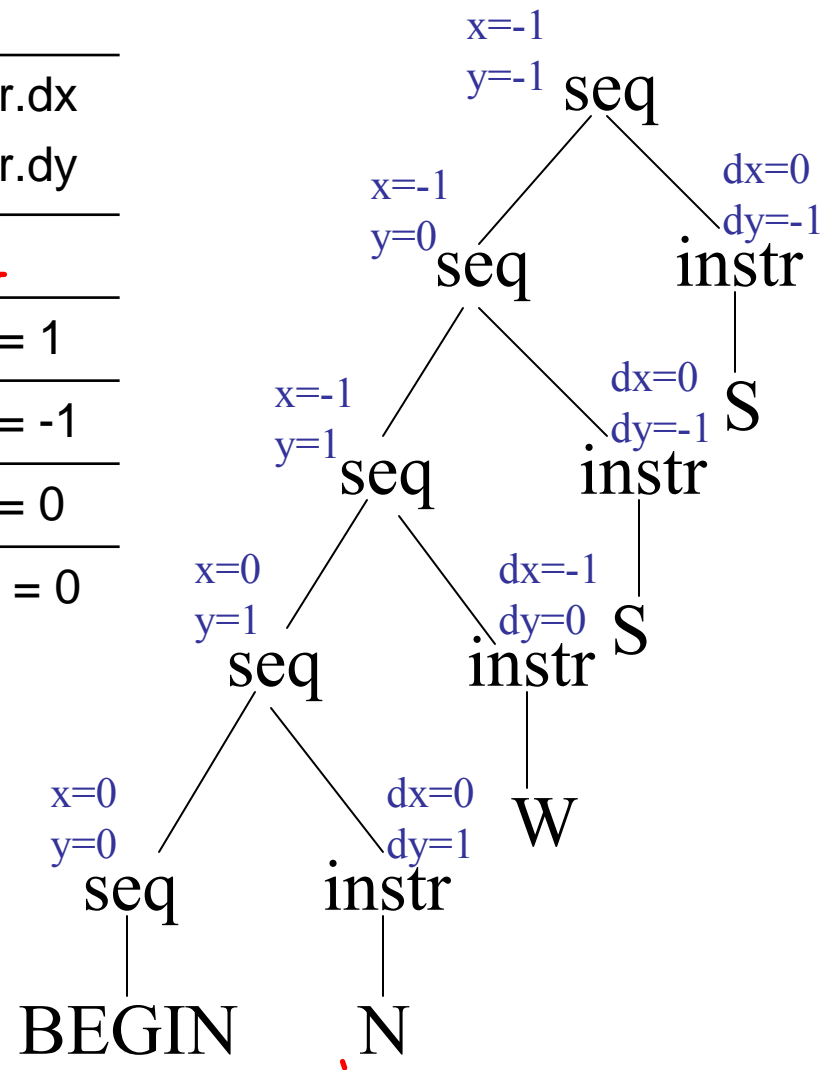

## Synthesized Attributes – Grid Positions

Production	Semantic Actions
$\text{seq} \rightarrow \text{seq}_1 \text{ instr}$	$\text{seq.x} = \text{seq}_1.\text{x} + \text{instr.dx}$ $\text{seq.y} = \text{seq}_1.\text{y} + \text{instr.dy}$
$\text{seq} \rightarrow \text{BEGIN}$	$\text{seq.x} = 0, \text{seq.y} = 0$
$\text{instr} \rightarrow \text{NORTH}$	$\text{instr.dx} = 0, \text{instr.dy} = 1$
$\text{instr} \rightarrow \text{SOUTH}$	$\text{instr.dx} = 0, \text{instr.dy} = -1$
$\text{instr} \rightarrow \text{EAST}$	$\text{instr.dx} = 1, \text{instr.dy} = 0$
$\text{instr} \rightarrow \text{WEST}$	$\text{instr.dx} = -1, \text{instr.dy} = 0$

## Synthesized Attributes –Annotating the parse tree

Production	Semantic Actions
$\text{seq} \rightarrow \text{seq}_1 \text{ instr}$	$\text{seq.x} = \text{seq}_1.\text{x} + \text{instr.dx}$ $\text{seq.y} = \text{seq}_1.\text{y} + \text{instr.dy}$
$\text{seq} \rightarrow \text{BEGIN}$	$\text{seq.x} = 0, \text{seq.y} = 0$
$\text{instr} \rightarrow \text{NORTH}$	$\text{instr.dx} = 0, \text{instr.dy} = 1$
$\text{instr} \rightarrow \text{SOUTH}$	$\text{instr.dx} = 0, \text{instr.dy} = -1$
$\text{instr} \rightarrow \text{EAST}$	$\text{instr.dx} = 1, \text{instr.dy} = 0$
$\text{instr} \rightarrow \text{WEST}$	$\text{instr.dx} = -1, \text{instr.dy} = 0$

Input: BEGIN N W S S

## Inherited Attributes

if an attribute is not synthesized, it is inherited.

- An inherited attribute for a nonterminal B at a parse tree node N is defined by a semantic rule associated with the production at the parent of N.
- The production must have B as a symbol in its body.
- Inherited attribute at node N is defined only in terms of attribute values at N's parent, N itself and N's siblings.

Example:

Production	Semantic Rules
$A \rightarrow B C D$	$B.b := A.a + C.b$

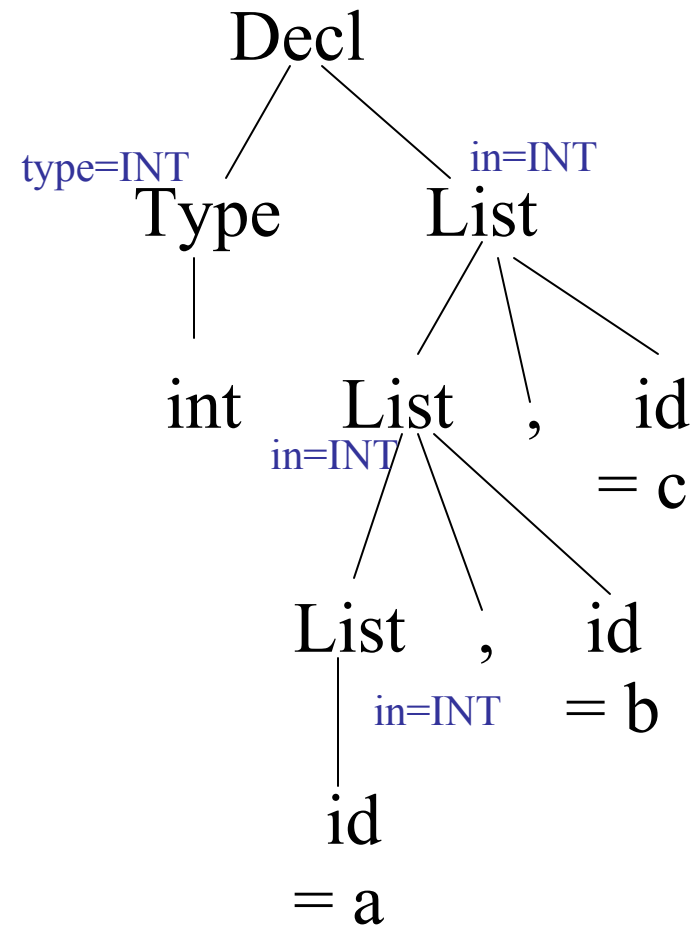

## Inherited Attributes – Determining types

Productions	Semantic Actions
$\text{Decl} \rightarrow \text{Type List}$	$\text{List.in} = \text{Type.type}$
$\text{Type} \rightarrow \text{int}$	$\text{Type.type} = \text{INT}$
$\text{Type} \rightarrow \text{real}$	$\text{T.type} = \text{REAL}$
$\text{List} \rightarrow \text{List}_1, \text{id}$	$\text{List}_1.\text{in} = \text{List.in},$ $\text{addtype}(\text{id.entry.List.in})$
$\text{List} \rightarrow \text{id}$	$\text{addtype}(\text{id.entry}, \text{List.in})$

## Inherited Attributes – Example

Productions	Semantic Actions
$\text{Decl} \rightarrow \text{Type List}$	$\text{List.in} = \text{Type.type}$
$\text{Type} \rightarrow \text{int}$	$\text{Type.type} = \text{INT}$
$\text{Type} \rightarrow \text{real}$	$\text{T.type} = \text{REAL}$
$\text{List} \rightarrow \text{List}_1, \text{id}$	$\text{List}_1.\text{in} = \text{List.in},$ $\text{addtype}(\text{id.entry.List.in})$
$\text{List} \rightarrow \text{id}$	$\text{addtype}(\text{id.entry}, \text{List.in})$

Input: int a,b,c

## Syntax-Directed Definitions

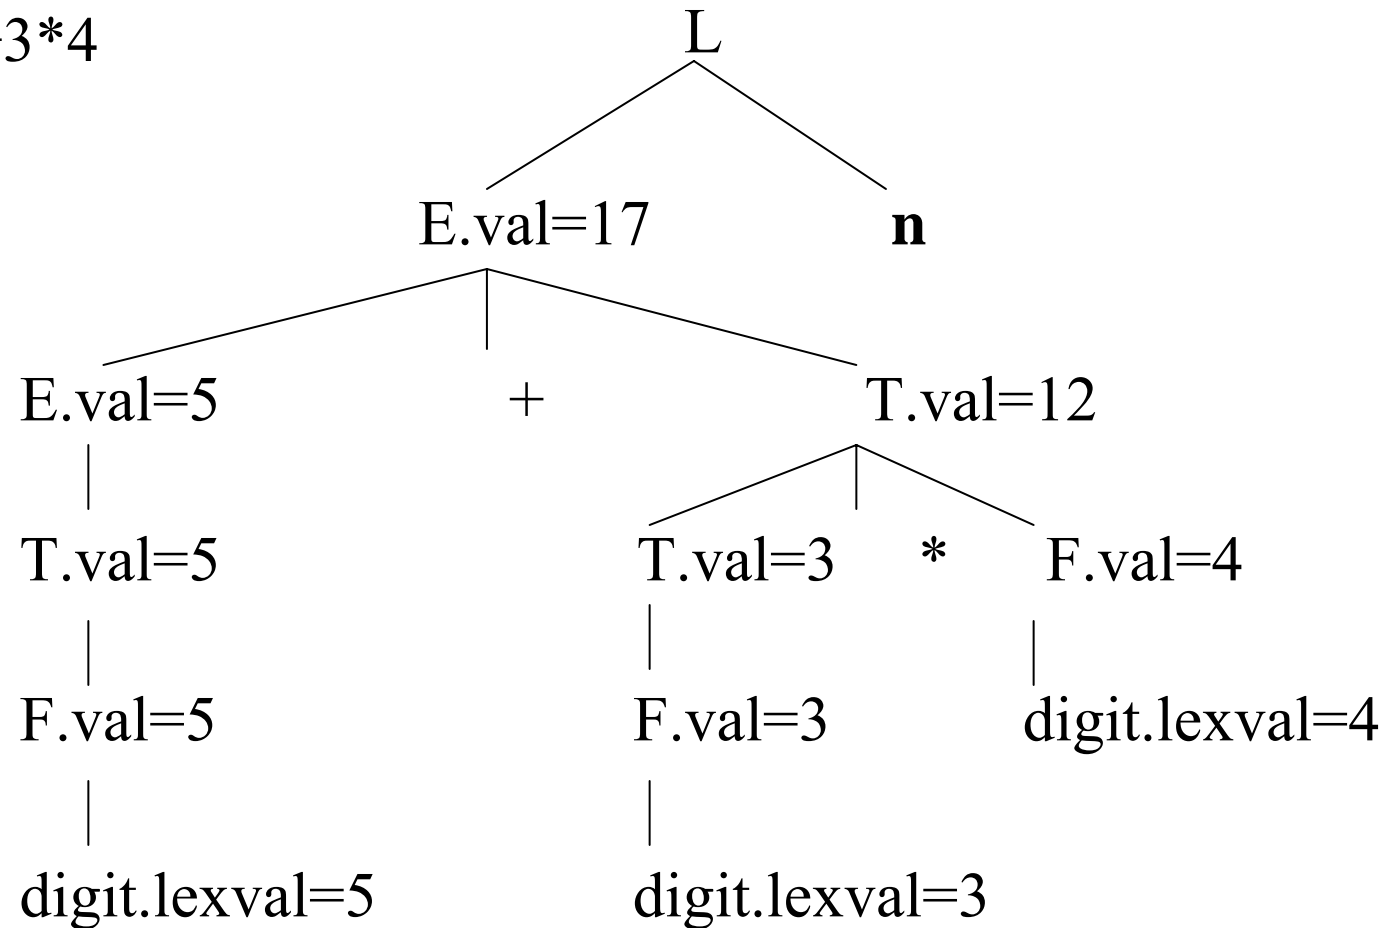

- *Semantic rules* set up dependencies between attributes which can be represented by a *dependency graph*.
- This *dependency graph* determines the evaluation order of these semantic rules.
- Evaluation of a semantic rule defines the value of an attribute. But a semantic rule may also have some side effects such as printing a value.

## Annotated Parse Tree

- A parse tree showing the values of attributes at each node is called an **annotated parse tree**.
- The process of computing the attributes values at the nodes is called **annotating** (or **decorating**) of the parse tree.
- Of course, the order of these computations depends on the dependency graph induced by the semantic rules.

## Annotated Parse Tree -- Example

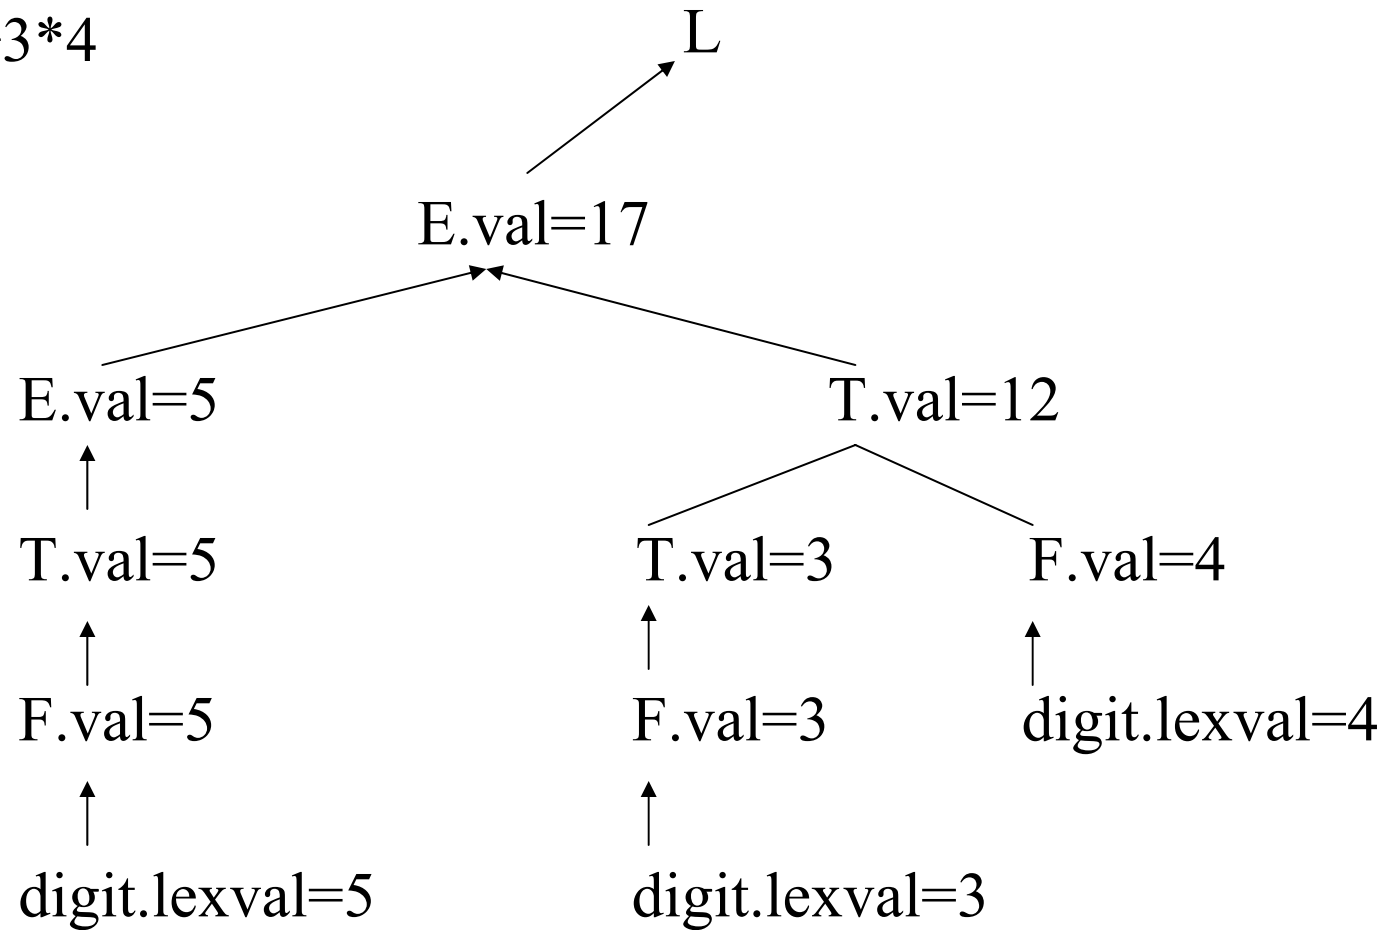

Input: 5+3\*4

## Dependency Graph

Input:  $5+3*4$

## Syntax-Directed Definition (SDD)

- In a syntax-directed definition, each production  $A \rightarrow \alpha$  is associated with a set of semantic rules of the form:

$$b = f(c_1, c_2, \dots, c_n) \quad \text{where } f \text{ is a function,}$$

and  $b$  can be one of the followings:

→  $b$  is a **synthesized attribute** of  $A$  and  $c_1, c_2, \dots, c_n$  are attributes of the grammar symbols in the production ( $A \rightarrow \alpha$ ).

OR

→  $b$  is an **inherited attribute** one of the grammar symbols in  $\alpha$  (on the right side of the production), and  $c_1, c_2, \dots, c_n$  are attributes of the grammar symbols in the production ( $A \rightarrow \alpha$ ).

## Attribute Grammar

- So, a semantic rule  $b=f(c_1, c_2, \dots, c_n)$  indicates that the attribute  $b$  *depends on* attributes  $c_1, c_2, \dots, c_n$ .
- In a **syntax-directed definition**, a semantic rule may just evaluate a value of an attribute or it may have some side effects such as printing values.
- An **attribute grammar** is a syntax-directed definition in which the functions in the semantic rules cannot have side effects (they can only evaluate values of attributes).

## Syntax-Directed Definition – Example2

<u>Production</u>	<u>Semantic Rules</u>
$E \rightarrow E_1 + T$	$E.loc = \text{newtemp}(), E.code = E_1.code \parallel T.code \parallel \text{add}$ $E_1.loc, T.loc, E.loc$
$E \rightarrow T$	$E.loc = T.loc, E.code = T.code$
$T \rightarrow T_1 * F$	$T.loc = \text{newtemp}(), T.code = T_1.code \parallel F.code \parallel \text{mult}$ $T_1.loc, F.loc, T.loc$
$T \rightarrow F$	$T.loc = F.loc, T.code = F.code$
$F \rightarrow ( E )$	$F.loc = E.loc, F.code = E.code$
$F \rightarrow \text{id}$	$F.loc = \text{id.name}, F.code = ""$

- Symbols E, T, and F are associated with synthesized attributes *loc* and *code*.
- The token **id** has a synthesized attribute *name* (it is assumed that it is evaluated by the lexical analyzer).
- It is assumed that  $\parallel$  is the string concatenation operator.

## Syntax-Directed Definition – Inherited Attributes

### Production

### Semantic Rules

$D \rightarrow T L$

$L.in = T.type$

$T \rightarrow \text{int}$

$T.type = \text{integer}$

$T \rightarrow \text{real}$

$T.type = \text{real}$

$L \rightarrow L_1 \text{ id}$

$L_1.in = L.in, \text{ addtype}(\text{id.entry}, L.in)$

$L \rightarrow \text{id}$

$\text{addtype}(\text{id.entry}, L.in)$

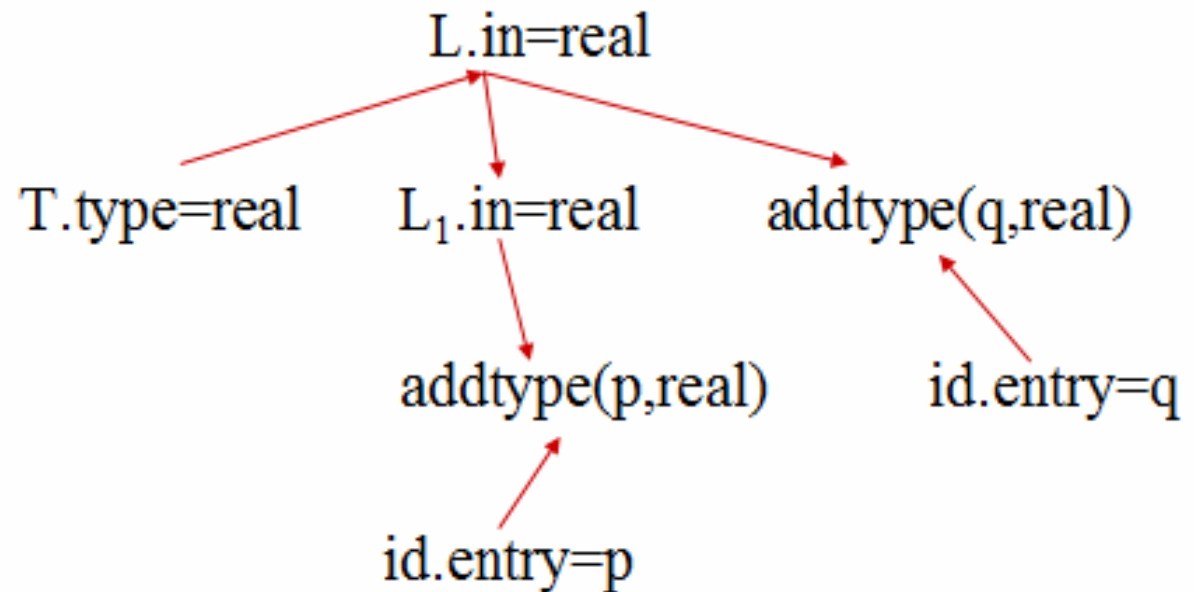

- Symbol T is associated with a synthesized attribute *type*.
- Symbol L is associated with an inherited attribute *in*.

## A Dependency Graph – Inherited Attributes

Input: real p q

*parse tree*

*dependency graph*
